

WORK RIGHTS 500 Visa for PhD, permitting full-time employment in Australia

EDUCATION **University of Technology Sydney** Sydney, Australia
Ph.D in Computer Science 2022 - April 2026 (*expected*)

- Research topic: Recommender Systems
- Advisor: [Jie Lu](#)

The University of Melbourne Melbourne, Australia
M.Phil in Computer Science 2018 - 2021

- Research topic: Interpretable Machine Learning / Explainable AI
- Advisor: [James Bailey](#)

Shenzhen University Shenzhen, China
Bachelor in Computer Science 2012 - 2016

PROFESSIONAL EXPERIENCE **Huawei Technologies Co., Ltd** Dongguan, China
Machine Learning Engineer 2021.12 - 2022.10

- I worked in a Shared Services Platforms team (so-called middle end), providing machine learning/algorithm solutions to various departments within Huawei. Projects included:
 - **Path Enumeration Algorithm for Graph:** Conducted research to identify and implement state-of-the-art path enumeration algorithms for Huawei's internal routing device queries (To Identify the shortest path between any two network switches.). Achieved higher efficiency compared to general graph engine. (e.g., Neo4j).
 - **Explainable Machine Learning:** Researched and implemented model-agnostic attribution-based explainability methods for machine learning models (primarily decision trees and CNNs), providing interpretable insights into model predictions and enhancing transparency for internal stakeholders. (e.g., SHAP, LIME for feature importance analysis).

SenseTime Co., Ltd Shenzhen, China
Machine Learning Engineer (intern) 2021.04 - 2021.10

- I worked in the IRDC (international R&D center) at SenseTime. Projects included:
 - **Object Detection:** Utilized internal SenseTime tools to train object detection models (R-CNNs series). Managed the full workflow, including model training, quantization, and conversion into NPU-compatible versions. Ensured models achieved industry-level accuracy and efficiency, and deployed them into SenseTime products.
 - **Research:** Conducted research on Neural Architecture Search (NAS), aiming to develop a branch-balanced CNN architecture (a variant of HRNet) that achieves improved inference efficiency under multiprocessing scenarios.

Taisau Co., Ltd. Shenzhen, China
Machine Learning Engineer 2016.07 - 2018.08

- I provided support related to anything about deep learning for this computer vision startup:
 - **Model Training:** Explored and implemented various technical approaches to enhance model applicability in industrial scenarios. Effective strategies included: large-margin-based methods to improve performance for fine-grained classification (Primarily focused on large-margin softmax-based techniques.); and test-time data adaptation.
 - **Model Deployment:** Optimized and deployed an 18-layer ResNet model to run inference within 200ms on a low-power CPU environment. Techniques applied include model pruning, parameter sparsification, low-rank approximation, and integration of efficient operators (e.g., ShuffleNet).
